SUMMARY

Software engineer with four years of production experience who now builds AI systems: agents, tool and MCP integrations, prompt architectures, and automation pipelines that run without supervision. Ships features end to end on a HIPAA regulated healthcare SaaS platform and uses coding agents in that codebase daily, including the guardrail work that makes generated code safe to merge. Looking for a role where building with AI is the job itself rather than a side effect of it.

TECHNICAL SKILLS

- **AI and agents:** Claude Code, MCP server integration, agent and skill authoring, prompt engineering, conversation design for voice agents, tool calling, AI assisted development and code review, local Whisper speech to text
- **Languages:** Python, JavaScript, TypeScript, PHP, SQL, HTML, CSS
- **Frontend:** React, React Native, Tailwind CSS, component architecture, responsive and accessible UI
- **Backend and data:** RESTful API design and integration, MySQL, MongoDB, Cloudflare D1, FHIR healthcare resources, JSON, XML
- **Cloud and DevOps:** Cloudflare Workers, AWS ECS, Docker, Azure, Git and GitHub, CI/CD
- **Practices:** Agile Scrum, peer code review, production defect triage, automated and manual testing, technical documentation, SDLC and compliance in a HIPAA environment

AI AND AUTOMATION SYSTEMS

- **Agent based development environment.** Designed a personal operating layer on Claude Code with eleven custom skills, session lifecycle hooks, and MCP server integrations for issue tracking, documents, and browser control. It routes a task to the correct repository, pulls the matching ticket and meeting context before work starts, and keeps state files in sync across otherwise isolated agent sessions.
- **Guardrails for AI assisted development in a regulated codebase.** Moved architecture, security, and portal isolation rules into layered instruction files that load automatically when an agent session opens in the repository, so constraints are in context before the first line is generated rather than caught in review.
- **Local meeting intelligence pipeline.** Python and Bash system using a launchd watcher, multi track audio capture, Whisper transcription with voice activity detection, and cross track speaker attribution, producing structured summaries that lead with action items. Runs fully on device, so no call audio leaves the machine.
- **Inbound AI voice receptionist.** Designed the conversation architecture for a voice agent that handles inbound calls for service businesses: urgency triage before anything else, an emergency path that transfers to a human instead of booking, a required fields gate so it cannot book without service address and callback details, and tool calls for scheduling, contact updates, and transfer. Productized it with positioning, pricing, and a live marketing site.
- **Serverless intake and follow up backend.** Cloudflare Worker on D1 with Resend email delivery and cron scheduled follow up sequences, serving form submissions from every site I run behind a single deployment, separated by tenant.

EXPERIENCE

CareMetx, LLC

2024 to Present

Software Engineer · Bethesda, MD (Remote)

- Own features end to end on the PX Technology client portal, an enterprise healthcare SaaS platform medical practices use to manage prior authorizations, benefit verifications, and patient enrollments, from requirements

through code review, QA, and production support.

- Use AI coding agents daily for implementation, refactoring, and test generation, reviewing all generated output against repository architecture rules, security requirements, and portal isolation constraints before it reaches a pull request.
- Build and integrate RESTful APIs and vendor service integrations, mapping clinical and demographic data to FHIR resources in JSON and XML for pharmaceutical program partners.
- Develop schema driven patient enrollment forms in React, React Native, PHP, and JavaScript for web and tablet, adding validation and conditional logic that cut manual data cleanup for practice staff.
- Deploy containerized API integration services to AWS ECS with Docker, supporting reliable data exchange between practices and third party systems.
- Participate in peer code review and Scrum ceremonies on a small agile team, and diagnose and resolve defects across development, test, and production environments.

Shumaker Technology Group

2023 to 2024

Web Developer and Technical Support Engineer · Lansing, MI (Remote)

- Delivered 20 or more custom website and web application projects using PHP, MySQL, JavaScript, HTML, CSS, and WordPress, increasing client engagement by 30 percent.
- Built a statistics tracking application for a client with more than 3,500 employees, letting staff record daily performance data and generating the custom reports that drove bonus and promotion decisions.
- Integrated a membership management platform API so member records stayed in sync between systems instead of being maintained twice, and integrated third party APIs for payment processing and shipping logistics.
- Maintained hosting for more than 500 client sites and resolved 100 or more support tickets, diagnosing Apache, plugin, and application failures while holding 99.9 percent uptime and reducing average resolution time by 35 percent.

Independent Web and Hosting Practice

2025 to Present

Design, Build, and Deploy · Remote

- Design, build, and deploy client sites on Cloudflare Workers with custom domains, DNS, and email routing, backed by the shared serverless intake and follow up service described above.

EDUCATION

Michigan State University

Sept 2019 to May 2023

B.S. Information Science · East Lansing, MI
